Continuation Sheet (PTO-303)

Application No.

Continuation of 3(a): Applicants present arguments of the 102(b) rejection of Barthel et al. which are directed towards newly presented limitations. As such, further search and/or consideration would be required and the proposed amendment will not be entered.

Regarding the 102(b) rejection of Bergstrom, Applicants argue that Bergstrom does not teach pyrogenically prepared silica and further does not teach any process steps which would yield a low structure. However, pyrogenically produced silica, as stated in previous Office actions is construed as a product-by-process limitation within a product claim (instant claim 1) and a process claim (instant claims 2-8). As such, there is nothing claimed which distinguishes the silica made by Bergstrom with that of the instant application. Regarding process steps, such as a ball-mill treatment, there is nothing claimed which requires such a treatment, or any treatment which necessitates a low structure to be formed.

Regarding the 102(b) rejection of Barthel et al., Applicants argue that Barthel et al. do not teach with sufficient specificity, pyrogenically produced silica having both vinyl groups and hydrophobic groups. However, every silane taught by Barthel (paragraph 0039) are hydrophobic and nearly half of the disclosed silanes are vinylsilanes. Further, claim 1 is written such that the hydrophobic groups could be any hydrophobic group. The limitation "such as trimethylsilyl and/or dimethylsilyl and/or monomethylsilyl" does not limit the hydrophobic groups to those species. The vinylsilanes, in effect could also serve as the hydrophobic groups. Applicants argue that there is nothing claimed which would yield a low structure silica as taught in Barthel et al. However, there is nothing claimed requiring a low structure silica to be produced.
